

A Comparative Study of Impact of Mobile Payment Apps on Youth with Reference to Google Pay and PhonePe

A PROJECT REPORT

Submitted By

Ayesha Bamahdi

Batch: 2022 - 2024

Under the Guidance of

Ms. Gayathri B

In partial fulfilment for the award of degree

Of

POST GRADUATION DIPLOMA IN MANAGEMENT

**INSTITUTE OF COMPUTERS AND BUSINESS MANAGEMENT - SCHOOL OF
BUSINESS EXCELLENCE (ICBM-SBE)**

HYDERABAD 500048

ICBM-School of Business Excellence

BONAFIDE CERTIFICATE

This is to certify that the project entitled “**A Comparative study of impact of Mobile Payment Apps on youth with reference to Google Pay and PhonePe**” by **Ayesha Bamahdi (22169)** submitted in partial fulfilment degree of Post-Graduation Diploma in Management during the academic year 2022- 2024 is a bonafide record of work carried out under the guidance and supervision of **Ms. Gayathri B.**

Dr. S. Zarar
Principal

Ms. Gayathri B
Faculty Guide.

TO WHOMSOEVER IT MAY CONCERN

This is to certify that **Miss Ayesha Bamahdi** has completed an internship at **Startup Login** (A subsidiary of 99SA Ventures Private Limited) from 16th May 2023 to 5th July 2023 as **DIGITAL & MARKETING OPERATIONS** Intern.

During her tenure she completed various tasks related to Marketing for Startup Login.

She completed tasks that were assigned to her in a timely manner and also showed keen interest in learning through observations and execution. During her stint with us, we found her overall performance **EXCELLENT**.

We wish her all the very best for her future endeavors.

A handwritten signature in black ink, appearing to read 'Sanjay Enishetty'.

SANJAY ENISHETTY

FOUNDER & CEO
99 SA VENTURES
PRIVATE LIMITED

UNDERTAKING

I declare that the work presented in this project titled “**A Comparative study of impact of Mobile Payment Apps on youth with reference to Google Pay and PhonePe**”, submitted to the Marketing Department, ICBM-School of Business Excellence for the award of the Post Graduate Diploma in Management (PGDM), and is my original work. I have not plagiarized or submitted the same work for the award of any other degree. In case this undertaking is found incorrect, I accept that my degree may be unconditionally withdrawn.

February, 2024

Hyderabad.

Ayesha Bamahdi

ACKNOWLEDGEMENT

I feel incredibly honoured and privileged to express my warmest regards to my esteemed Institution, **ICBM-School of Business Excellence**, and the Department of **Marketing**. Their dedication to providing a comprehensive understanding of marketing has been instrumental in my academic journey.

I would like to extend my deepest gratitude to my invaluable project guide, **Ms. Gayathri B.** Having the opportunity to work with her on my insightful project, "**A Comparative Study of the Impact of Mobile Payment Apps on Youth with Reference to Google Pay and PhonePe**" was truly a privilege. Her unwavering support, guidance, and mentorship were crucial in helping me achieve success.

My immense gratitude also goes to our Director/Principal, **Prof. Shamsuddin Zarar**, Chairperson, **Dr. Ritu Zarar**, and Director-Academics, **Prof. Jitender Govindani**. Their commitment to building an enriching academic environment with the resources and means to nurture our skills and potential has been invaluable. Thanks to their leadership, I feel empowered to reach my full potential.

Finally, I would like to express my sincere thanks to all the esteemed members of the Marketing Department for their constant support and guidance throughout my studies. Their expertise and willingness to help have made a significant contribution to my learning experience.

With Regards and Gratitude

Ayesha Bamahdi

ABSTRACT

In today's digital age, smartphone payment apps have transformed how people conduct financial transactions, particularly among young people. This study explores the usage of Google Pay and PhonePe , two well-known mobile payment services, including adoption trends, primary drivers, and obstacles. The study intends to determine the underlying causes that propel the adoption and usage of mobile applications and investigate their influence on financial behaviour, including saving and spending, by examining survey data from a varied sample of young users.

The study finds notable distinctions in the ways that Google Pay and PhonePe affect young people's financial habits. It also emphasizes how important social influence is in getting people to use these apps, especially friends and family. The study also looks at how these platforms' financial education features are used by their users, providing insight into how well young people use these resources to improve their financial literacy.

The research presents providers of mobile payment apps useful information by means of an extensive examination of user experiences and attitudes. Strengthening security protocols, customizing financial education materials, and utilizing social media to promote uptake and involvement are among the suggestions. Mobile payment platforms can better serve the demands of younger consumers and encourage more financial inclusion and literacy in the digital age by addressing these factors.

CHAPTER 1

INTRODUCTION

INTRODUCTION

In today's world, mobile payment apps are changing how people handle money. They're easy to use, and since most people have smartphones, they're super convenient. Especially for young people, these apps are becoming the go-to way to manage money. This project is all about comparing two popular mobile payment apps, Google Pay and PhonePe, to see how they affect young people's money habits. Understanding how young people use these apps is important because they're a big part of the market and they often set trends for new technology. This project elaborates how these apps impact things like spending, saving, and how they're helping young people learn about money.

This study has three main goals. First, to see exactly how these apps change the way young people handle their money. This means looking at things like how much they spend, how much they save, and where their money goes when they use Google Pay or PhonePe. Second, to figure out what makes young people want to use these apps, and what might stop them from using them. Knowing this can help companies make better apps that people actually want to use. Lastly, to compare what features in each app are most helpful for young people. Things like how easy the app is to use, how safe it is, and if they offer any cool rewards or helpful tools to learn about money.

This project is important for a few reasons. With so many people using smartphones, these apps are changing how we handle money every day. Young people are especially important to study because they often set trends for new technology. Plus, these apps can help bridge the gap between people who have bank accounts and those who don't. They make it easier for everyone to be part of the economy. Also, by studying how young people use these apps, we can learn more about how technology is changing the way we think about money. But it's not just about money. These apps are part of a bigger shift in how we use technology and how we think about spending. They're not just tools for buying things; they're also changing how we think about privacy and security. And they're connected to lots of other parts of our digital lives, like social media and online shopping. So, by studying these apps, we can learn more about how technology is changing our lives in general. This project also looks ahead to see what new technology might change mobile payments in the future. Things like blockchain and artificial intelligence could completely change how we use these apps. By studying this now, we can be ready for whatever comes next and make sure these apps keep getting better for everyone.

This project also aims to understand how using mobile payment apps affects not just how young people manage their money, but also how it influences their lives in other ways. For example, as more transactions move online, it can change how people interact with businesses and each other. It might even affect things like how much people save or how they make financial decisions.

Moreover, the rise of these apps isn't just about technology—it's also about culture. In a world where everything is instant and on-demand, mobile payment apps fit right in. They're all about convenience and getting what you want quickly. By studying why young people are drawn to

these apps, we can learn more about what drives consumer behaviour in today's fast-paced world.

Additionally, this research looks at the bigger picture of how mobile payment apps fit into the digital landscape. They're not just standalone tools; they're part of a whole ecosystem of digital services. Understanding how these different parts work together can help us understand how technology is shaping our lives overall, especially when it comes to managing money. Privacy and security are also big concerns when it comes to using mobile payment apps. While they're convenient, some people worry about their personal information being safe. Understanding these concerns can help companies make their apps more secure and build trust with users.

Lastly, this research isn't just about what's happening now—it's also about what might happen in the future. New technologies are always emerging, and they could completely change how we think about money and payments. By staying ahead of these changes, we can make sure that mobile payment apps continue to be useful and safe for everyone to use. This project doesn't just stop at understanding the immediate effects of mobile payment apps. It also delves into their broader impact on society and the economy. As more people turn to digital transactions, it could reshape traditional ideas about money and how people participate in the economy. This shift can empower marginalized groups, like those with lower incomes or living in remote areas, by giving them easier access to financial services.

Moreover, the popularity of mobile payment apps reflects deeper changes in how people view money and spending. In today's world, where everything is about speed and convenience, these apps fit right in. They offer instant gratification and make spending money as easy as tapping a button. Studying why young people are drawn to these apps helps us understand broader trends in consumer behaviour. This research also considers how mobile payment apps connect to other parts of our digital lives. For many young users, these apps are just one piece of a larger puzzle that includes social media, online shopping, and entertainment. By understanding these connections, we can see how technology is shaping not just our finances, but our entire way of life.

Lastly, this project looks ahead to anticipate how future technologies might change the landscape of mobile payments. Innovations like blockchain and artificial intelligence could completely transform how we handle money. By staying ahead of these changes, we can ensure that mobile payment apps continue to evolve to meet the needs of users in an everchanging world.

Moreover, this project also considers the broader implications of mobile payment apps on society and the economy. As more people adopt digital transactions, it could reshape traditional ideas about money and economic participation. This shift may empower marginalized groups, such as those with lower incomes or in remote areas, by providing easier access to financial services. The popularity of mobile payment apps reflects deeper changes in how people

perceive money and spending. In today's fast-paced world, where convenience is paramount, these apps offer instant gratification and simplify spending with just a tap. Understanding why young people are attracted to these apps helps us grasp broader trends in consumer Behaviour .

Additionally, this research explores how mobile payment apps integrate with other aspects of our digital lives. For many young users, these apps are just one element of a larger digital ecosystem that includes social media, online shopping, and entertainment. By understanding these connections, we gain insight into how technology influences not only our finances but also our overall lifestyle. Privacy and security are also significant concerns regarding mobile payment apps. Despite their convenience, users worry about the safety of their personal information. Addressing these concerns is crucial for building trust and ensuring the continued reliability of these apps in daily life.

Finally, this study looks forward to anticipate how emerging technologies might shape the future of mobile payments. Innovations like blockchain and artificial intelligence have the potential to revolutionize how we manage money. By staying ahead of these developments, we can ensure that mobile payment apps remain relevant and adaptable to the evolving needs of users.

OBJECTIVES OF THE STUDY

1. To Quantify the impact of mobile payment apps on specific financial behaviour .
2. To identify key motivators and barriers for adoption based on user segments.
3. To compare the effectiveness of specific features in driving financial inclusion and literacy.

SCOPE OF THE STUDY

- This project will mainly look at young people, who are between 18 and 35 years old. They're the ones who usually like using mobile payment apps the most, and they're really important for understanding how money works online.
- This research will be conducted in certain areas to make sure we consider the culture, rules, and how things are set up there when we analyse the information.
- This research will only look at how two popular mobile payment apps, Google Pay and PhonePe, affect young people's money habits. Even though there are other apps out there, the study focuses on these two because they're used by a lot of people and have a big share of the market, making it easier to compare them.

- This research will measure and study certain money habits that are affected by using mobile payment apps. This includes how people spend money, save money, and what they understand about managing money, especially among young users.
- This study will look into why some young people start using mobile payment apps and why others don't. We'll explore what makes them convenient or safe to use, what rewards they offer, and if people trust them or find them useful.
- This study will compare and check how well certain features in Google Pay and PhonePe help young people understand and manage their money better. The study looks at things like how easy it is to use the app, how safe it keeps your information, what rewards you can get, and if they offer any helpful learning tools.s

LIMITATIONS OF THE STUDY

- The results of this study could be affected by the number of participants and how well they represent the larger group. This research aims to include a variety of people, but not everyone might be able to participate, which could limit how much we can say about everyone.
- The fast changes in technology and what people like might make it hard to get up-to-date information. The results of this study might only show how people are using mobile payment apps at one time, so they might not apply to the future.
- Using surveys or interviews where people report on themselves might cause some problems. People might want to give answers they think are "right" or they might not remember things correctly, which could make the results less accurate and reliable.
- This study is conducted only in Telangana, so the results might not apply to other places with different social, cultural, or rules.
- This study focuses on comparing Google Pay and PhonePe , the results might not be relevant to other mobile payment apps. Each app has its own special features, how users use them, and market situation.
- External factors like major economic shifts, changes in regulations, or advancements in technology could impact how young people use mobile payment apps. However, this study might not explore all of these aspects.

CHAPTER 2

INDUTRY PROFILE AND COMPANY PROFILE

INDUSTRY PROFILE

Introduction

The mobile app payment industry in India has witnessed exponential growth in recent years. With the rise of smartphones and internet penetration, mobile payment applications like Google Pay and PhonePe have become integral to daily transactions. This analysis provides an overview of the industry, highlighting key statistics, trends, and competitive dynamics.

Market Size and Growth

The digital payments market in India was valued at \$3 trillion in 2022 and is projected to grow at a compound annual growth rate (CAGR) of 26.2%, reaching \$7.8 trillion by 2027 (Finextra, 2023). Another report by Boston Consulting Group (2022) projects that digital payments in India will reach \$10 trillion by 2026 (Boston Consulting Group, 2022). The India Mobile Payments Market size is expected to reach USD 0.81 trillion in 2024 and grow at a CAGR of 26.52% to reach USD 2.61 trillion by 2029 (Mordor Intelligence, 2024). This significant growth is driven by government initiatives, increased smartphone adoption, and the rise of fintech solutions.

Key Players

The Indian mobile payments ecosystem is highly competitive, with several key players including Google Pay, PhonePe, Paytm, Amazon Pay, and others. Google Pay and PhonePe are among the most popular, with Google Pay boasting 67 million users in India, making it its largest market globally (Forbes, 2023).

1. **Google Pay:** Google Pay has leveraged its user-friendly interface and integration with Google services to capture a significant market share. The app facilitates various transactions, including peer-to-peer payments, bill payments, and in-store purchases.
2. **PhonePe:** PhonePe, backed by Flipkart and Walmart, has emerged as a dominant player with a broad range of services. It supports utility payments, mobile recharges, and provides a platform for financial services such as insurance and mutual funds.

Industry Trends

1. Unified Payments Interface (UPI)

The introduction of UPI by the National Payments Corporation of India (NPCI) has revolutionized the mobile payments industry. UPI enables instant money transfers between bank accounts through mobile apps, reducing reliance on cash and traditional banking.

2. Increased Adoption

According to a report by PayFuture (2023), the Indian mobile app payment industry is expected to reach a value of Rs 2.3 lakh crore. The pandemic accelerated the shift towards digital payments, with consumers and businesses adopting these solutions for their convenience and safety (PayFuture, 2023).

3. Regulatory Support

The Indian government's push towards a cashless economy through initiatives like Digital India has provided a conducive environment for the growth of mobile payments. Policies promoting digital transactions and fintech innovations have further fuelled this expansion.

Competitive Landscape

The competition among mobile payment apps is intense, with each platform striving to offer unique features and benefits to attract users. Google Pay and PhonePe are in a constant race to introduce new services and enhance user experience. Both platforms have expanded beyond payments to include financial products and services, aiming to become comprehensive financial solutions providers.

Feature	Google Pay	PhonePe
User Base	67 million in India	Over 300 million users
Key Services	Peer-to-peer payments, bill payments	Mobile recharges, utility payments, insurance
Unique Selling Point	Integration with Google services	Wide range of financial services
Market Strategy	Focus on user experience and innovation	Diversification into financial products

The mobile app payment industry in India is poised for continued growth, driven by technological advancements, supportive government policies, and increasing consumer acceptance. Google Pay and PhonePe are leading this transformation, continually evolving to meet the diverse needs of their users. As the market expands, these platforms are likely to play a crucial role in shaping the future of digital payments in India.

COMPANY PROFILE

GOOGLE PAY

Google Pay Tagline – *Money made simple*

About Google Pay

Google Pay, initially known as Android Pay or Tez, later rebranded as Google Pay, is a revolutionary mobile payment service developed by Google. It was designed to simplify online and in-person payments for users worldwide. Emerging from the tech giant Google, Google Pay reflects a commitment to innovation, convenience, and security in the digital payment landscape.

The journey of Google Pay began with the introduction of Android Pay in 2015, which allowed users to make purchases using their Android smartphones. Leveraging Near Field Communication (NFC) technology, Android Pay enabled contactless transactions at supported retailers. Over time, Google expanded the platform's capabilities, adding features like peer-to-peer payments and loyalty rewards.

In 2018, Google unified its payment platforms under the Google Pay brand, integrating functionalities from Android Pay, Google Wallet, and other services. This rebranding marked a significant step towards creating a seamless payment experience across Google's ecosystem.

Google Pay offers a range of features to streamline the payment process and enhance user convenience. Users can link various payment methods, such as credit cards, debit cards, and bank accounts, to their Google Pay accounts. The platform supports both online and in-store

transactions, enabling users to make purchases with a simple tap of their mobile devices. Additionally, Google Pay facilitates peer-to-peer payments, allowing users to send money to friends and family members effortlessly.

Security is a top priority for Google Pay, with robust encryption and authentication mechanisms safeguarding users' financial information. Whether making a purchase in-store or transferring funds online, users can trust that their transactions are protected against unauthorized access.

Google Pay has rapidly expanded its presence globally, reaching users in major markets like the United States, India, Southeast Asia, Africa, and beyond. Its versatility extends beyond traditional payments, with support for transit systems, online ticketing, and utility bill payments, making it an indispensable tool for everyday transactions.

Collaboration has been instrumental in Google Pay's success, as the platform continues to forge partnerships with banks, merchants, and technology providers. By integrating with leading financial institutions and retail chains, Google Pay expands its acceptance network and enhances the user experience.

Innovation remains at the core of Google Pay's strategy, with ongoing efforts to introduce new features and services. Whether through advanced biometric authentication or seamless integration with other Google products, Google Pay continually seeks to elevate the standard of digital payments.

As technology evolves, Google Pay remains at the forefront of innovation in the payments industry. With a commitment to simplicity, security, and accessibility, Google Pay empowers users to transact with confidence in an increasingly digital world, redefining the way people pay, shop, and interact online.

Furthermore, Google Pay prioritizes user privacy by generating virtual account numbers instead of transmitting actual payment card numbers during transactions. This approach, combined with the EMV Payment Tokenization Specification, enhances security and protects customer payment information from unauthorized access. Additionally, Google Pay offers users control over their lost devices by enabling them to remotely halt the service via Google's Find My Device feature, adding an extra layer of security and peace of mind.

Adding payment cards to Google Pay is simple and user-friendly. Users can either take a photo of their card or manually enter the card information to link it with their Google Pay account. Once added, users can make payments at points of sale by holding their authenticated device to the NFC reader, making transactions quick and convenient.

In terms of technology, Google Pay leverages the EMV Payment Tokenization Specification to ensure secure transactions. By replacing the customer's credit or debit card primary account number with a tokenized device primary account number, Google Pay enhances transaction security and privacy.

Moreover, Google Pay supports Consumer Device Cardholder Verification Method (CDCVM) in EMV-mode transactions, enabling biometric, pattern, or passcode authentication directly on the device. This feature streamlines the payment process and may eliminate the need for cardholders to sign receipts or enter PINs, further enhancing convenience for users.

In summary, Google Pay stands as a leading mobile payment solution, offering a combination of security, convenience, and accessibility. With its widespread availability across multiple regions and support for a diverse range of payment methods and authentication mechanisms, Google Pay continues to play a pivotal role in shaping the future of digital payments. By driving financial inclusion and literacy among users worldwide, Google Pay is redefining the landscape of commerce in the digital age.

PHONEPE

PhonePe Tagline - *Karte Ja. Badhte Ja*, which means “Keep doing, Keep going”.

About PhonePe

PhonePe, established in December 2015, has emerged as a leading mobile payment platform in India, offering a comprehensive range of financial services and innovative solutions to its vast user base. The company's journey began with the rebranding and incorporation of a digital wallet service in April 2016, under the leadership of its founder Sameer Nigam, who assumed the role of CEO.

A significant milestone in PhonePe's history was its partnership with Yes Bank in August 2016, leading to the launch of a UPI-based mobile payment app. This collaboration rapidly gained traction, with over one crore downloads within three months of its inception. By becoming the fastest Indian payment app to reach a five-crore badge on the Google Play Store and overtaking BHIM to become the market leader in UPI transactions by August 2017, PhonePe solidified its position in the digital payment landscape.

PhonePe's commitment to innovation and strategic partnerships has been evident throughout its journey. The company introduced several groundbreaking initiatives, including low-cost POS devices, tax-saving funds, international UPI payments, and cross-border UPI transactions, among others. These efforts have not only expanded the scope of PhonePe's services but have also contributed to its widespread acceptance and adoption by merchants and consumers alike.

In terms of market penetration, PhonePe boasts an impressive network, with acceptance at over 3.5 crore offline and online merchant outlets, covering 99% of pin codes in India. The platform serves more than 44 crore registered users, with over 20 crore monthly active users

as of the latest available data. This significant user base underscores PhonePe's significance in driving digital financial inclusion and literacy across the country.

Moreover, PhonePe's regulatory compliance and licensing further reinforce its credibility and reliability as a financial services provider. The company holds a license from the Reserve Bank of India for the issuance and operation of a Semi Closed Prepaid Payment system, authorizing its operations in the digital payment space.

PhonePe's success is not only reflected in its user base and market share but also in its recognition and accolades within the industry. The company has received numerous awards for its contributions to digital payments and fintech innovation, including recognition from the National Payments Corporation of India (NPCI), IAMAI India Digital Awards, and ASSOCHAM's Fintech & Digital Payments Awards, among others.

Despite facing legal challenges early on, PhonePe demonstrated resilience and successfully navigated through regulatory hurdles to emerge as a dominant player in the Indian digital payment ecosystem. The company's commitment to its employees is also evident through initiatives such as ESOP buybacks, highlighting its dedication to fostering a supportive and rewarding work culture.

Overall, PhonePe's journey epitomizes innovation, growth, and resilience in the ever-evolving landscape of digital finance. With its diverse range of services, strategic partnerships, and commitment to customer satisfaction, PhonePe continues to shape the future of mobile payments in India and beyond.

CHAPTER 3

REVIEW OF LITERATURE

LITERATURE REVIEW

- 1. NAIR P, N. A. N. D. A. N. A., JERRY, N. R., P BEN, N. I. V. I. N., & ANTONY, A. P. (2023). A STUDY ON IMPACT OF FINTECH ON YOUNGSTERS WITH REFERENCE TO PAYMENT APPS.**

Nair, Jerry, Ben, and Antony looked into how apps on phones that handle money (like Venmo or Cash App) affect young people. They wanted to know how these apps change the way young folks handle money. They asked questions, talked to people, and looked at data to figure out what's going on. What they found was that a lot of young people are using these apps every day for stuff like sending money to friends, buying things online, and paying bills. They found out that young people like using these apps because they're easy to use, they're everywhere, and sometimes you get rewards or discounts for using them.

The study also found that these money apps are changing how young people think about money. Instead of using traditional ways like paper and pen to track their spending, now many young folks are using these apps to do it all digitally. They're also using these apps to save money and make budgets. And because of all this, traditional banks might have a tough time because now there's more competition from these apps, and banks might need to change the way they do things to keep up with what young people want.

Overall, the study shows that these money apps are really changing how young people handle money. It's not just about making payments anymore; it's about how they think about money and how they manage it. It's important for everyone, like banks and the people who make these apps, to understand this and adapt to make sure they're meeting the needs of young people in today's digital world.

- 2. Shivane, A., Hippargekar, M. P., & Sargar, M. S. ANALYTICAL STUDY ON USAGE OF UPI.**

Shivane, Hippargekar, and Sargar studied how people use a digital payment system called Unified Payments Interface (UPI) in India. They wanted to know things like how many transactions happen, how often people use UPI, who uses it, and why. By looking at a lot of data and analysing how people use UPI, they wanted to find out trends, problems, and opportunities related to using this payment system. They also looked into what makes people choose UPI, like if it's easy to use, safe, and if it works well with other payment methods.

Their study helps us understand why UPI is so popular and how it's changing how people pay for things in India. It's not just about making payments; it's about making them quickly, safely, and in a way that works for everyone. This research can help make UPI even better and more widely used, which could lead to more people having access to digital payments and less reliance on cash.

3. **Nathani, S., Chakhiyar, N., & Pandey, S. K. (2022). A Study on Consumers Perception towards Digital Payment System in India and Various Affecting Its Growth. Issue 3 Int'l JL Mgmt. & Human., 5, 1162.**

Nathani, Chakhiyar, and Pandey looked into what people in India think about digital payments and why some people use them more than others. They wanted to understand how digital payments are changing and what problems people face when they try to use them. They talked to people and analysed data to learn about how people feel, what they like, and what they don't like about using digital payment methods. They also looked at things like how safe people feel, if the technology is good enough, what the government does, and if using digital payments is easy or not.

Their study helps us understand why some people in India use digital payments a lot and why some don't. They found out that things like feeling safe, having good technology, supportive government policies, and easy-to-use systems are important for making digital payments popular. By learning from their research, policymakers and companies can make digital payments better and easier for everyone in India, which could help more people use them instead of cash.

4. **Aggarwal, G. (2020). E-Wallet Market in India and to Identify Various Factors Affecting Customer Preference. Annals of the Romanian Society for Cell Biology, 484-499.**

Aggarwal's study in 2020 looked into the e-wallet market in India. E-wallets are like digital wallets on your phone where you can store money and make payments online. Aggarwal wanted to understand why people choose one e-wallet over another. They looked at things like how easy it is to use the e-wallet, how safe it is, how fast transactions happen, the quality of customer service, and if there are any special offers or promotions.

The study found out what makes some e-wallets more popular than others in India. They saw that factors like being easy to use, having good security, fast transactions, good customer service, and offering special deals play a big role in why people choose one ewallet over another. By understanding what customers like and don't like, e-wallet companies can make their services better and stand out from the competition, which helps the whole industry grow and improve.

5. **Singh, R. A Comparative Study on PhonePe and Googlepay (Doctoral dissertation, Rashtrasant Tukadoji Maharaj Nagpur University)**

Singh did a study comparing two popular mobile payment apps, PhonePe and Google Pay. They did this study as part of their PhD at Rashtrasant Tukadoji Maharaj Nagpur University. Singh looked at lots of things about these apps, like what features they have, how easy they are to use, how safe they are, and how well they help people make digital transactions. They wanted to see which one is better overall and how satisfied users are with each app.

Singh's study helps us understand which of these apps is better at things like making transactions quickly, being reliable, and giving users a good experience. By comparing

Google Pay and PhonePe in detail, Singh's research helps people like policymakers, business people, and other researchers understand more about the mobile payment industry in India. This helps everyone make better decisions about digital finance in the country.

6. JOSE, J., KRISHNAKUMAR, K., MILINA, M., & Menon, A. (2023). Digital Wallets: Impact on the economy with reference to youth in Ernakulam city.

Jose, Krishnakumar, Milina, and Menon did a study on how using digital wallets affects the economy, specifically looking at young people in Ernakulam city. They wanted to see how using digital wallets changes how young folks spend money in the city. They did this by asking questions and analyzing data about how young people use digital wallets, like where they spend money, what they like, and what they think about using digital wallets.

Their study found out that digital wallets are important for making transactions without using cash, and they help include more people in the financial system. This means that more young people in Ernakulam are using digital wallets to buy things instead of using cash. Overall, their research helps us understand how digital wallets are changing how young people in cities like Ernakulam handle money, and how this affects the economy.

7. Pandey, A., Shetty, A., Chheda, V., Kaur, T., & Vartak, M. (2021). GROWTH OF THE DIGITAL PAYMENTS INDUSTRY AND ITS FUTURE IN INDIA. GROWTH, 8(2).

Pandey, Shetty, Chheda, Kaur, and Vartak wrote an article about how digital payments are growing in India and what it means for the future. They looked at why digital payments are becoming more popular, like new technology, government support, and how people are changing how they spend money. They found that digital payments help more people access banking services, use less cash, and make the economy grow. They also talked about what might happen in the future with digital payments, like how to keep them safe from cyber-attacks and how to make sure they follow the rules. Overall, their research helps us understand how digital payments are changing in India and what it means for everyone involved, like government, businesses, and people who use digital payments.

8. AJMERA, H., & BHATT, D. V. (2021). A Study on Factors Affecting Consumer Attitude and Intention Towards the Mobile Payment Applications in Gujarat.

Ajmera and Bhatt did a study in 2021 to figure out why people in Gujarat either like or don't like using mobile payment apps (MPAs). They wanted to understand what factors influence people's opinions and Behaviour s towards these apps. They asked people questions and analyzed data to see how things like usefulness, ease of use, security, trust, and special offers affect whether people use mobile payment apps or not. Their findings help us understand why some people use these apps a lot while others don't, and what can be done to encourage more people to use them in Gujarat.

Their research gives us valuable insights into why people in Gujarat choose to use or avoid mobile payment apps. By understanding these factors, businesses, government officials,

and marketers can come up with strategies to make these apps more appealing and easier to use, which could lead to more people using them for digital payments in the region.

9. **Kumar, A., Choudhary, R. K., Mishra, S. K., Kar, S. K., & Bansal, R. (2022). THE GROWTH TRAJECTORY OF UPI-BASED MOBILE PAYMENTS IN INDIA: ENABLERS AND INHIBITORS. *Indian Journal of Finance and Banking*, 11(1), 45-59.**

Kumar, Choudhary, Mishra, Kar, and Bansal wrote an article in 2022 about how mobile payments using the Unified Payments Interface (UPI) are growing in India. They wanted to understand why this type of digital payment is becoming more popular and what might be stopping it from growing even more. They found that things like government rules, better technology, and more people having smartphones are helping UPI-based mobile payments grow quickly. But they also found that concerns about safety, not knowing enough about it, and problems with different apps working together are making it harder for more people to use these mobile payments. Their research helps policymakers, banks, and others figure out how to overcome these challenges and make UPI-based mobile payments even more common in India.

10. **Mahesh, A., & GaneshBhat, S. (2022). India's Digital Payment Landscape—An Analysis. *International Journal of Case Studies in Business, IT and Education (IJCSBE)*, 6(1), 223-236.**

Mahesh and GaneshBhat wrote an article in 2022 about how digital payments are changing in India. They looked at different aspects of digital payments, like how they're growing and what's influencing them. They found that things like government support, better technology, and how people are using money are making digital payments more common in India. But they also found that there are challenges, like worries about cybersecurity, rules and regulations, and problems with the infrastructure needed for digital payments. Their research helps policymakers, businesses, and others understand what's happening with digital payments in India and what needs to be done to make them even better.

11. **Bhatt, V. (2021). An empirical study on analyzing a user's intention towards using mobile wallets; measuring the mediating effect of perceived attitude and perceived trust. *Turkish Journal of Computer and Mathematics Education (TURCOMAT)*, 12(10), 5332-5353.**

Bhatt conducted a study in 2021 to understand why people might want to use mobile wallets, like apps for making payments on phones. They wanted to see if people's attitudes and how much they trust these apps play a role in whether they want to use them or not. They asked people questions and looked at the data to see how people's attitudes and trust affect their intentions to use mobile wallets. They found that when people have positive attitudes and trust these apps, they're more likely to want to use them. This study helps businesses and policymakers figure out how to encourage more people to use mobile wallets by focusing on improving attitudes and trust towards them.

12. Pricilla, R. S., Selvarani, A., & Sivanesan, G. (2020). FACTORS INFLUENCING INTENTION TO USE MOBILE WALLET: AN EMPIRICAL ANALYSIS OF INDIAN CONSUMERS. *International Journal of Management (IJM)*, 11(12).

Pricilla, Selvarani, and Sivanesan did a study in 2020 to figure out why Indian consumers might want to use mobile wallets, like apps for making payments on phones. They wanted to understand what factors influence people's intentions to adopt this technology. They asked people questions and looked at the data to see what mattered most. They found that people are more likely to want to use mobile wallets if they think they're useful and easy to use. Also, people care a lot about trusting that these apps are secure and reliable. Interestingly, recommendations from friends and family also play a big role in whether people want to use mobile wallets or not. Overall, their research helps businesses and policymakers figure out how to encourage more people in India to use mobile wallets by focusing on making them useful, easy to use, and trustworthy.

13. Ilieva, G., Yankova, T., Dzhabarova, Y., Ruseva, M., Angelov, D., & KlisarovaBelcheva, S. (2023). Customer Attitude toward Digital Wallet Services. *Systems*, 11(4), 185.

Ilieva conducted a study in 2023 to learn about how customers feel about digital wallet services, like apps for making payments on phones. They wanted to understand what customers think about these services and how they use them. They asked people questions and analyzed the answers to see what mattered most to customers, like how useful and easy to use the apps were, and how safe people felt using them.

The study found that most customers have positive feelings about digital wallet services, especially if they find them useful and easy to use. Security concerns were also important to customers, meaning they want to trust that their data and money are safe when using these apps. Overall, this research helps businesses and service providers understand what customers want and how to make digital wallet services better for them.

14. Dev, H., Gupta, R., & Kumar, D. (2024). From Cash to Cashless: UPI's Impact on Spending Behaviour among Indian Users. *arXiv preprint arXiv:2401.09937*.

Dev, Gupta, and Kumar conducted a study in 2024 to see how using the Unified Payments Interface (UPI) affects how people spend money in India. They wanted to understand if switching from using cash to making digital payments with UPI changes how much and how often people buy things. They looked at data and asked people questions to see if there were any changes in how much people spend, how often they make transactions, and what they spend money on after they start using UPI.

Their findings show that using UPI leads to more transactions happening more often among Indian users. They also found that people start using digital payments more for different things they buy. Overall, this research shows how UPI is changing how people spend money in India by making it easier and more common to make digital payments instead of using cash.

CHAPTER 4

RESEARCH METHODOLOGY

RESEARCH METHODOLOGY

The study is to conduct a comparative analysis of mobile payment apps, notably Google Pay and PhonePe, on the youth population. Understanding the impact of mobile payment solutions on financial behaviour, motivators, and barriers is critical in light of their widespread availability. The study's goal is to provide insights into how these apps influence young users' financial habits and views.

Research Design

The study uses a quantitative approach, collecting data methodically from a sample of 100 participants. It uses an exploratory approach to compare users' experiences and views of Google Pay and PhonePe. By gathering data at a single point in time, the study aims to provide an overview of the current level of mobile payment usage among youths.

Objectives

1. To Quantify the impact of mobile payment apps on specific financial behaviour

The objective involves determining the extent to which mobile payment apps influence various financial behaviour such as spending, saving, and budgeting.

2. To identify key motivators and barriers for adoption based on user segments

The objective aims to understand the elements that influence or hinder the adoption of mobile payment apps across various segments of youth users.

3. To compare the effectiveness of specific features in driving financial inclusion and literacy

The purpose of this objective is to examine the effectiveness of various Google Pay and PhonePe features in promoting financial inclusion and literacy among young users.

Sources of Data

When selecting the technique of data collecting to be used in the analysis, the data sources must first be identified and made clear.

There are two categories of data sources

Primary Data Sources

Primary data are those that are collected for the first time to solve an issue and are hence unique. It may be received from individuals, families, or representatives.

The data for this project was collected directly by distributing questionnaires.

Survey Area – Telangana

Sample Size – 100

Research Tool – Questionnaire

Data Type - Primary Data

Secondary Data Sources

Secondary data have previously been gathered by someone else, must be determined, and have undergone statistical analysis. External sources include books, periodical publications, reports, magazines, online research papers, blogs, and Google Scholar.

In the context of the project study, knowledge is primarily derived from online research papers, Google Scholar, reports, and analysis and research on the major data source, which consists of respondents who completed the questionnaire.

Sampling Plan

Sampling Unit

The target population comprises of young people aged 18 to 35 who actively use mobile payment apps.

Sampling Size

A sample of 100 participants will be selected to accurately represent the target population.

Sampling Method

Convenience sampling will be used, with participants chosen based on their availability and desire to participate. This strategy enables the effective collection of data within the study's limits.

Data Collection Method

The data will be obtained mostly through a standardized questionnaire distributed to participants. The questionnaire consists of a series of closed-ended questions intended to elicit particular responses about mobile payment app usage, financial practices, motivators, and barriers.

Questionnaire Design

The questionnaire is designed to collect demographic information such as age, occupation, and primary mobile payment app usage. It also contains Likert scale items that examine participants' thoughts and experiences with many areas of mobile payment app usage, such as spending habits, budgeting methods, security concerns, and the impact of social factors.

Data Analysis

The quantitative data obtained from the questionnaire will be evaluated using statistical approaches such as descriptive statistics, chi-square tests, and regression analysis. Descriptive statistics will be used to summarize the sample's characteristics and relevant variables. Chisquare tests will be used to investigate relationships between categorical variables, while regression analysis will be used to identify predictors of specific financial actions and attitudes.

CHAPTER 5

DATA ANALYSIS AND INTERPRETATION

DEMOGRAPHIC DATA ANALYSIS

1. Demographic Data

Count of No of Respondents	Occupation			
Age	Employed	Other	Student	Grand Total
20			1	1
21	2		8	10
22	2	1	16	19
23	2	2	13	17
24	8	2	12	22
25	7		5	12
26	2	1		3
27	3		1	4
28	5	1		6
29	6			6
Grand Total	37	7	56	100

Chart:

Interpretation: 1. Primary Mobile Payment App

Preference:

- The data shows that respondents predominantly use either Google Pay or PhonePe as their primary mobile payment app.

- Out of the total 100 respondents, 47 of them use Google Pay as their primary mobile payment app, while 53 use PhonePe.
- 2. **Comparison of Google Pay and PhonePe Usage:**
 - PhonePe has a slightly higher usage among the respondents compared to Google Pay, with 53 respondents compared to 47. ○ This indicates that PhonePe might have a slightly higher market penetration or user preference among the surveyed youth compared to Google Pay.
- 3. **Overall Implication:**
 - Both Google Pay and PhonePe have a significant presence among the youth demographic surveyed. ○
 - The data suggests a competitive landscape between these two mobile payment apps in capturing the youth market segment.
 - Understanding the factors influencing the choice between these two apps could provide valuable insights for marketing strategies and product development for both companies.

In summary, the data presents a clear overview of the primary mobile payment app usage among the youth demographic in the study, showcasing a fairly balanced distribution between Google Pay and PhonePe. This insight lays the groundwork for deeper exploration into the underlying factors influencing app preference and usage PhonePe among this demographic

2. Primary Mobile App Usage

Primary Mobile Payment App Usage	Count of Respondents
Google Pay	47
PhonePe	53
Grand Total	100

Chart

Interpretation:

➤ Preference Distribution:

- The data indicates that out of the total 100 respondents surveyed, 47 of them prefer Google Pay as their primary mobile payment app, while 53 respondents opt for PhonePe.
- This suggests a slight inclination towards PhonePe among the surveyed population.

➤ Implications for Market Share:

- PhonePe holds a slightly higher market share compared to Google Pay among the surveyed youth demographic.
- The preference for PhonePe might be attributed to various factors such as user interface, features, promotional activities, or partnerships with merchants.

3. Usage duration of Mobile Payment Apps

How long have you been using mobile payment apps?	Count of Respondents
1 year - 3 years	41
6 months to 1 year	11
less than 6 months	7
more than 3 years	41
Grand Total	100

Chart:

Interpretation:

➤ Duration of Usage:

- The data categorizes respondents based on the duration they have been using mobile payment apps.
- Among the respondents, 41 individuals have been using mobile payment apps for 1 year to 3 years, while another 41 respondents have been using them for more than 3 years.
- This indicates that a significant portion of the surveyed population has been using mobile payment apps for a relatively longer duration.

➤ Recent Adopters:

- A smaller proportion of respondents, totalling 18 individuals, have been using mobile payment apps for less than a year. This includes 11 respondents who have been using them for 6 months to 1 year and 7 respondents who have been using them for less than 6 months.
- This suggests a recent uptake of mobile payment apps among a subset of the surveyed population.

4. Financial Behaviour and Attitude Analysis

Since using mobile payment apps (Google Pay/PhonePe), I spend less cash and more on digital transactions.	Average of Respondents agreeing with the statement
Agree	54.08571429
Disagree	78.25
Neutral	48.23529412
Strongly agree	44.6
Strongly disagree	60
Grand Total	50.5

Chart

Interpretation

➤ Average Agreement with the Statement:

- The data presents the average level of agreement among respondents regarding the statement "Since using mobile payment apps (Google Pay/PhonePe), I spend less cash and more on digital transactions."
- On average, respondents tend to agree with the statement, with an average score of 50.5.
- This suggests that a majority of the surveyed population perceives a shift towards digital transactions and reduced cash usage since adopting mobile payment apps.

➤ Breakdown of Agreement Levels:

- Among the respondents:

- 54.09% agree with the statement.
- 44.6% strongly agree. ○ 48.24% are neutral. ○ 78.25% disagree. ○ 60% strongly disagree.

➤ **Implications for Cashless Transactions:**

- The high proportion of respondents agreeing or strongly agreeing with the statement indicates a positive impact of mobile payment apps on encouraging cashless transactions.
- This aligns with the broader trend towards digital payments, driven by factors such as convenience, security, and incentives offered by mobile payment providers.

➤ **Challenges and Skepticism:**

- Despite the overall agreement with the statement, a significant proportion of respondents (78.25%) disagree or strongly disagree.
- This suggests that there may be challenges or barriers to fully embracing digital transactions for some individuals, such as concerns about security, reliability, or preference for cash transactions.

5. Overall impact of Mobile Payment Apps

Mobile payment apps have had an adverse impact on me.	Count of Respondents
20%- 50%	27
50% - 80%	39
80% - 100%	22
Less than 20%	12
Grand Total	100

Chart

Interpretation

➤ Impact Distribution:

- The data categorizes respondents based on the perceived impact of mobile payment apps on them.
- Among the respondents:
 - 12 individuals perceive the impact of mobile payment apps to be less than 20%.
 - 27 individuals perceive the impact to be between 20% and 50%.
 - 39 individuals perceive the impact to be between 50% and 80%.
 - 22 individuals perceive the impact to be between 80% and 100%.

➤ Adverse Impact Perception:

- The data specifically focuses on the perception of adverse impacts resulting from mobile payment apps.

- The majority of respondents perceive a moderate to significant adverse impact, with 61 individuals (39 + 22) indicating impacts ranging from 50% to 100%.

6. Security concerns and Brand trust

Count of Respondents	I trust the reputation and brand image of Google Pay/PhonePe over other payment apps.					
Security concerns prevent me from using mobile payment apps more frequently.	Agree	Disagree	Neutral	Strongly agree	Strongly disagree	Grand Total
Agree	27	2	2	1		32
Disagree	12	2		3	1	18
Neutral	10		13	1		24
Strongly agree	1		2	16		19
Strongly disagree			1	5	1	7
Grand Total	50	4	18	26	2	100

Chart

Interpretation

➤ Trust in Brand Reputation:

- The table shows respondents' perceptions of trust in the reputation and brand image of Google Pay/PhonePe compared to other payment apps.
- Among the respondents:
 - 32 individuals agree that they trust the reputation and brand image of Google Pay/PhonePe over other payment apps.
 - 18 individuals disagree. ○ 24 individuals are neutral. ○ 19 individuals strongly agree.
 - 7 individuals strongly disagree.

➤ Security Concerns:

- The table also reflects respondents' views on whether security concerns prevent them from using mobile payment apps more frequently.
- Among the respondents:
 - 50 individuals agree that security concerns prevent them from using mobile payment apps more frequently.
 - 18 individuals disagree. ○ 26 individuals are neutral. ○ 2 individuals strongly agree.
 - 4 individuals strongly disagree.

7. Influence of Social Circle

My friends and family using mobile payment apps influenced me to adopt them.	Count of Respondents
Agree	41
Disagree	6
Neutral	25
Strongly agree	23
Strongly disagree	5
Grand Total	100

Chart

Interpretation

➤ Influence of Social Circle:

- The table shows respondents' perceptions of how their friends and family using mobile payment apps influenced their adoption.
- Among the respondents:
 - 41 individuals agree that their friends and family using mobile payment apps influenced them to adopt.
 - 6 individuals disagree.
 - 25 individuals are neutral.
 - 23 individuals strongly agree.
 - 5 individuals strongly disagree.

➤ Significant Influence:

- A majority of respondents (64%) either agree or strongly agree that the adoption of mobile payment apps by their friends and family influenced their own adoption.

- This indicates a significant social influence in the decision-making process surrounding mobile payment app adoption.

➤ **Minority Opinions:**

- A small proportion of respondents (11%) either disagree or strongly disagree with the influence of their social circle on their adoption of mobile payment apps.
- These individuals may have been influenced by factors other than their friends and family.

➤ **Neutral Responses:**

- A notable number of respondents (25%) express neutral sentiments regarding the influence of their social circle.
- This suggests that while some individuals may have been influenced by their friends and family, others may have made independent decisions or have not considered the influence of their social circle on their adoption of mobile payment apps.

8. Need for educational resources

I need more educational resources within the apps to feel comfortable using them for complex financial tasks.	Count of Respondents
Agree	43
Disagree	8
Neutral	24
Strongly agree	20
Strongly disagree	5
Grand Total	100

Chart

Interpretation

➤ Perceived Need for Educational Resources:

- The table shows respondents' perceptions regarding the need for more educational resources within mobile payment apps to feel comfortable using them for complex financial tasks.
- Among the respondents:
 - 43 individuals agree that they need more educational resources.
 - 8 individuals disagree.
 - 24 individuals are neutral.
 - 20 individuals strongly agree.
 - 5 individuals strongly disagree.

➤ **Demand for Educational Resources:**

- A majority of respondents (63%) either agree or strongly agree that they require more educational resources within mobile payment apps for complex financial tasks.
- This indicates a significant demand for educational content to enhance users' confidence and proficiency in using mobile payment apps for advanced financial activities.

➤ **Minority Opinions:**

- A minority of respondents (13%) either disagree or strongly disagree with the need for additional educational resources.
- These individuals may already feel sufficiently comfortable using mobile payment apps for complex financial tasks or may prefer alternative sources of information.

➤ **Neutral Responses:**

- A notable number of respondents (24%) express neutral sentiments regarding the need for educational resources.
- This suggests that while some individuals recognize the potential benefits of educational content, others may not perceive it as a pressing requirement for their usage of mobile payment apps.

9. Interests in investments and Financial Inclusion

Count of Respondents	I believe mobile payment apps can play a significant role in promoting financial inclusion among young people.					
Features like investment options have made me more interested in starting to invest.	Agree	Disagree	Neutral	Strongly agree	Strongly disagree	Grand Total
Agree	29		3	4		36
Disagree	2	2	5			9
Neutral	13	2	13	1		29
Strongly agree	4		2	17		23
Strongly disagree	1		1		1	3
Grand Total	49	4	24	22	1	100

Chart

Interpretation

➤ Belief in Financial Inclusion:

- The table shows respondents' beliefs about the potential role of mobile payment apps in promoting financial inclusion among young people.
- Among the respondents:

- 36 individuals agree that mobile payment apps can play a significant role in promoting financial inclusion.
- 9 individuals disagree. ○ 29 individuals are neutral. ○ 23 individuals strongly agree.
- 3 individuals strongly disagree.

➤ **Interest in Investment Features:**

- The table also reflects respondents' interest in investment options provided by mobile payment apps.
- Among the respondents:
 - 36 individuals agree that features like investment options have made them more interested in starting to invest.
 - 9 individuals disagree. ○ 29 individuals are neutral. ○ 23 individuals strongly agree.
 - 3 individuals strongly disagree.

➤ **Perceptions on Financial Inclusion:**

- A majority of respondents (59%) either agree or strongly agree that mobile payment apps can play a significant role in promoting financial inclusion among young people.
- This indicates a positive perception of the potential impact of mobile payment apps on expanding financial access and opportunities, particularly among the youth demographic.

➤ **Interest in Investment Features:**

- Similarly, a majority of respondents (59%) either agree or strongly agree that features like investment options have sparked their interest in starting to invest.
- This suggests that investment features integrated into mobile payment apps have the potential to stimulate financial literacy and encourage investment among users.

➤ **Minority Opinions:**

- A minority of respondents (12%) either disagree or strongly disagree with the belief in financial inclusion through mobile payment apps, and a similar minority (12%) disagree or strongly disagree with the interest in investment features.
- These individuals may have reservations or skepticism regarding the effectiveness or relevance of mobile payment apps in promoting financial inclusion or investment activities.

10. Recommendation and overall Satisfaction

I would recommend Google Pay/PhonePe to others based on my positive experience with their features	Count of Respondents
Agree	49
Disagree	6
Neutral	22
Strongly agree	23
Grand Total	100

Chart

Interpretation

➤ Recommendation of Google Pay/PhonePe:

- The table shows respondents' willingness to recommend Google Pay/PhonePe to others based on their positive experience with the app's features.
 - Among the respondents:
 - 49 individuals agree that they would recommend Google Pay/PhonePe to others.
 - 6 individuals disagree.
 - 22 individuals are neutral.
 - 23 individuals strongly agree.
- **Overall Satisfaction:**

- A majority of respondents (72%) either agree or strongly agree that they would recommend Google Pay/PhonePe to others based on their positive experience.
- This indicates a high level of overall satisfaction with the features and performance of Google Pay/PhonePe among the surveyed population.

➤ **Minority Opinions:**

- A minority of respondents (6%) disagree with the recommendation of Google Pay/PhonePe to others, while a similar minority (22%) express neutral sentiments.
- These individuals may have had less favorable experiences with the app's features or may not feel strongly about recommending it to others.

➤ **Strength of Recommendation:**

- The fact that 23 individuals strongly agree with the recommendation suggests a significant level of enthusiasm and confidence in the app's capabilities and user experience.

11. Usage of Financial Education tools

I have used the financial education tools (articles, quizzes) offered by the apps to improve my financial knowledge.	Count of Respondents
Agree	38
Disagree	13
Neutral	29
Strongly agree	16
Strongly disagree	4
Grand Total	100

Chart

Interpretation

➤ Usage of Financial Education Tools:

□ The table shows respondents' engagement with financial education tools such as articles and quizzes offered by the apps to improve their financial knowledge. □ Among the respondents:

- 38 individuals agree that they have used the financial education tools.
- 13 individuals disagree.
- 29 individuals are neutral.
- 16 individuals strongly agree.
- 4 individuals strongly disagree.

➤ **Engagement with Financial Education:**

- A majority of respondents (54%) either agree or strongly agree that they have used the financial education tools offered by Google Pay/PhonePe.
- This indicates a significant level of interest and participation in utilizing the educational resources provided by the apps.

➤ **Minority Opinions:**

- A minority of respondents (17%) disagree or strongly disagree with using the financial education tools, while another 29% express neutral sentiments.
- These individuals may have limited awareness of the available tools, may prefer alternative sources of financial education, or may not perceive the tools as relevant to their needs.

➤ **Strength of Engagement:**

- The fact that 16 individuals strongly agree with using the financial education tools suggests a notable level of enthusiasm and recognition of the value provided by these resources.

12. Effectiveness of Bill Reminders

Features like bill reminders within the apps help me manage my finances more responsibly.	Count of Respondents
Agree	41
Disagree	7
Neutral	19
Strongly agree	31
Strongly disagree	2
Grand Total	100

Chart

Interpretation

➤ Effectiveness of Bill Reminders:

- The table shows respondents' perceptions of how features like bill reminders within the apps help them manage their finances more responsibly.
- Among the respondents:
 - 41 individuals agree that bill reminders within the apps help them manage their finances more responsibly.
 - 7 individuals disagree.
 - 19 individuals are neutral.

- 31 individuals strongly agree.
- 2 individuals strongly disagree.

➤ **Positive Impact on Financial Responsibility:**

- A majority of respondents (72%) either agree or strongly agree that features like bill reminders within the apps contribute to managing their finances more responsibly.
- This indicates a significant positive impact of bill reminders on users' financial behaviour and habits.

➤ **Minority Opinions:**

- A minority of respondents (9%) disagree or strongly disagree with the effectiveness of bill reminders, while another 19% express neutral sentiments.
- These individuals may have alternative methods of managing their finances or may not find bill reminders within the apps to be useful for their specific needs.

➤ **Strength of Agreement:**

- The fact that 31 individuals strongly agree with the effectiveness of bill reminders suggests a high level of confidence in the value provided by these features in promoting financial responsibility.

13. Utilization of Financial inclusion features

I believe mobile payment apps can play a significant role in promoting financial inclusion among young people	Count of Respondents
Agree	49
Disagree	4
Neutral	24
Strongly agree	22
Strongly disagree	1
Grand Total	100

Chart

Interpretation

➤ **Belief in Financial Inclusion:**

- The table shows respondents' beliefs about the potential role of mobile payment apps in promoting financial inclusion among young people.
- Among the respondents:
 - 49 individuals agree that mobile payment apps can play a significant role in promoting financial inclusion.
 - 4 individuals disagree.
 - 24 individuals are neutral.
 - 22 individuals strongly agree.
 - 1 individual strongly disagrees.

➤ **Perceptions on Financial Inclusion:**

- A majority of respondents (71%) either agree or strongly agree that mobile payment apps can play a significant role in promoting financial inclusion among young people.
- This indicates a positive perception of the potential impact of mobile payment apps on expanding financial access and opportunities, particularly among the youth demographic.

➤ **Minority Opinions:**

- A minority of respondents (5%) disagree or strongly disagree with the belief in financial inclusion through mobile payment apps, while another 24% express neutral sentiments.
- These individuals may have reservations or skepticism regarding the effectiveness or relevance of mobile payment apps in promoting financial inclusion among young people.

➤ **Strength of Agreement:**

- The fact that 22 individuals strongly agree with the belief in financial inclusion suggests a notable level of enthusiasm and confidence in the potential of mobile payment apps to address financial inclusion challenges.

14. Impact Assessment

Mobile payment apps have had an adverse impact on me.	Count of Respondents
20%- 50%	27
50% - 80%	39
80% - 100%	22
Less than 20%	12
Grand Total	100

Chart

Interpretation

➤ Perceived Adverse Impact:

- The table shows respondents' perceptions of the adverse impact mobile payment apps have had on them.

Among the respondents:

- 27 individuals perceive the adverse impact to be between 20% and 50%.
- 39 individuals perceive the adverse impact to be between 50% and 80%.

- 22 individuals perceive the adverse impact to be between 80% and 100%.
- 12 individuals perceive the adverse impact to be less than 20%.

➤ **Distribution of Adverse Impact:**

- A significant portion of respondents (88%) report experiencing some degree of adverse impact from mobile payment apps:
 - 27% perceive a moderate impact (20% - 50%).
 - 39% perceive a substantial impact (50% - 80%).
 - 22% perceive a high impact (80% - 100%).

➤ **Minority with Minimal Impact:**

- A smaller group of respondents (12%) report experiencing less than 20% adverse impact, indicating minimal negative effects from using mobile payment apps.

15. Motivator 1: Convenience and Speed

Count of Respondents	Primary mobile payment app you use		
My main reason for using mobile payment apps is convenience and speed of transactions	Google Pay	PhonePe	Grand Total
Agree	16	20	36
Disagree	5	2	7
Neutral	10	7	17
Strongly agree	15	23	38
Strongly disagree	1	1	2
Grand Total	47	53	100

Chart

Interpretation

- **Motivation by Convenience and Speed:**
 - The table shows respondents' reasons for using mobile payment apps, specifically focusing on convenience and speed of transactions.
 - The data is split between users of Google Pay and PhonePe .

- **Breakdown of Responses:**

- Among Google Pay users:

- 16 individuals agree that convenience and speed are their main reasons for using the app.
 - 5 individuals disagree.
 - 10 individuals are neutral.
 - 15 individuals strongly agree.
 - 1 individual strongly disagrees.

- Among PhonePe users:

- 20 individuals agree that convenience and speed are their main reasons for using the app.
 - 2 individuals disagree.
 - 7 individuals are neutral.
 - 23 individuals strongly agree.
 - 1 individual strongly disagrees.

- **Overall Agreement:**

- Combining the responses, a majority of respondents (74%) either agree or strongly agree that convenience and speed are their main reasons for using mobile payment apps:
 - 36% agree.
 - 38% strongly agree.

This indicates that convenience and speed are significant motivators for both Google Pay and PhonePe users.

- **Neutral and Disagreement:**

- A smaller proportion of respondents are either neutral (17%) or disagree (9%) with the statement:
 - 17% are neutral.
 - 7% disagree.
 - 2% strongly disagree.
 - These respondents might have other primary motivators for using mobile payment apps, such as rewards, security, or peer influence.

- **Comparison Between Google Pay and PhonePe :**

- A higher percentage of PhonePe users (43 out of 53, or 81%) either agree or strongly agree compared to Google Pay users (31 out of 47, or 66%) that convenience and speed are their main reasons for usage.
 - This indicates that PhonePe users may value convenience and speed slightly more than Google Pay users.

16. Motivator 2: Influence of Friends and Family

Count of Respondents	Primary mobile payment app you use		
My friends and family using mobile payment apps influenced me to adopt them.	Google Pay	PhonePe	Grand Total
Agree	21	20	41
Disagree	4	2	6
Neutral	13	12	25
Strongly agree	7	16	23
Strongly disagree	2	3	5
Grand Total	47	53	100

Chart

Interpretation

➤ Influence of Friends and Family:

- The table shows respondents' perceptions of how their friends and family influenced their decision to adopt mobile payment apps.
- The data is split between users of Google Pay and PhonePe .

➤ Breakdown of Responses:

- Among Google Pay users:

- 21 individuals agree that friends and family influenced their adoption of the app.
- 4 individuals disagree.
- 13 individuals are neutral.
- 7 individuals strongly agree.
- 2 individuals strongly disagree.
- Among PhonePe users:
 - 20 individuals agree that friends and family influenced their adoption of the app.
 - 2 individuals disagree.
 - 2 individuals are neutral.
 - 16 individuals strongly agree.
 - 3 individuals strongly disagree.

➤ **Overall Agreement:**

- Combining the responses, a significant portion of respondents (64%) either agree or strongly agree that friends and family influenced their decision to use mobile payment apps:
 - 41% agree.
 - 23% strongly agree.

This indicates that social influence is a notable factor in the adoption of both Google Pay and PhonePe.

➤ **Neutral and Disagreement:**

- A smaller proportion of respondents are either neutral (25%) or disagree (11%) with the statement:
 - 25% are neutral.
 - 6% disagree.
 - 5% strongly disagree.
- These respondents might have been influenced by other factors such as personal research, advertising, or the app's features.

➤ **Comparison Between Google Pay and PhonePe :**

- The influence of friends and family appears slightly more significant among PhonePe users, with 68% (36 out of 53) either agreeing or strongly agreeing compared to 60% (28 out of 47) of Google Pay users.
- This suggests that social circles may play a more prominent role in the adoption of PhonePe.

17. Motivator 3: Need for Educational Resources

Count of Respondents	Primary mobile payment app you use		
	Google Pay	PhonePe	Grand Total
I have used the financial education tools (articles, quizzes) offered by the apps to improve my financial knowledge.			
Agree	15	23	38
Disagree	6	7	13
Neutral	17	12	29
Strongly agree	6	10	16
Strongly disagree	3	1	4
Grand Total	47	53	100

Chart

Interpretation

➤ Use of Financial Education Tools:

- The table shows respondents' engagement with financial education tools (articles, quizzes) provided by the apps to improve their financial knowledge.
- The data is split between users of Google Pay and PhonePe .

➤ Breakdown of Responses:

- Among Google Pay users:
 - 15 individuals agree that they have used the financial education tools.
 - 6 individuals disagree.

- 17 individuals are neutral.
- 6 individuals strongly agree.
- 3 individuals strongly disagree.
- Among PhonePe users:
 - 23 individuals agree that they have used the financial education tools.
 - 7 individuals disagree.
 - 12 individuals are neutral.
 - 10 individuals strongly agree.
 - 1 individual strongly disagrees.

➤ **Overall Agreement:**

- Combining the responses, a significant portion of respondents (54%) either agree or strongly agree that they have used the financial education tools provided by the apps:
 - 38% agree.
 - 16% strongly agree.

This indicates a substantial level of engagement with the educational resources offered by both Google Pay and PhonePe .

➤ **Neutral and Disagreement:**

- A considerable proportion of respondents are either neutral (29%) or disagree (17%) with the statement:
 - 29% are neutral.
 - 13% disagree.
 - 4% strongly disagree.
- These respondents may not have utilized the educational tools available, may be unaware of their existence, or may not find them relevant to their needs.

➤ **Comparison Between Google Pay and PhonePe :**

- A higher percentage of PhonePe users (33 out of 53, or 62%) either agree or strongly agree compared to Google Pay users (21 out of 47, or 45%) that they have used the financial education tools.
- This suggests that PhonePe users might be more engaged with or aware of the educational resources provided by the app.

18. Barrier 1: Security Concerns

Count of Respondents	Primary mobile payment app you use		
Security concerns prevent me from using mobile payment apps more frequently	Google Pay	PhonePe	Grand Total
Agree	18	14	32
Disagree	6	12	18
Neutral	14	10	24
Strongly agree	4	15	19
Strongly disagree	5	2	7
Grand Total	47	53	100

Chart

Interpretation

➤ Security Concerns:

- The table shows respondents' views on whether security concerns prevent them from using mobile payment apps more frequently.
- The data is split between users of Google Pay and PhonePe .

➤ Breakdown of Responses:

- Among Google Pay users:

- 18 individuals agree that security concerns prevent them from using the app more frequently.
- 6 individuals disagree.
- 14 individuals are neutral.
- 4 individuals strongly agree.
- 5 individuals strongly disagree.
- Among PhonePe users:
 - 14 individuals agree that security concerns prevent them from using the app more frequently.
 - 12 individuals disagree.
 - 10 individuals are neutral.
 - 15 individuals strongly agree.
 - 2 individuals strongly disagree.

➤ **Overall Agreement:**

- Combining the responses, a significant portion of respondents (51%) either agree or strongly agree that security concerns prevent them from using mobile payment apps more frequently:
 - 32% agree.
 - 19% strongly agree.
- This indicates that security concerns are a considerable barrier for many users of both Google Pay and PhonePe .

➤ **Neutral and Disagreement:**

- A smaller but substantial proportion of respondents are either neutral (24%) or disagree (25%) with the statement:
 - 24% are neutral.
 - 18% disagree.
 - 7% strongly disagree.
- These respondents might have confidence in the security measures of their chosen mobile payment app or may not prioritize security concerns as highly.

➤ **Comparison Between Google Pay and PhonePe :**

- A higher percentage of Google Pay users (22 out of 47, or 47%) either agree or strongly agree compared to PhonePe users (29 out of 53, or 55%) that security concerns prevent them from using the app more frequently.
- PhonePe users appear to have more pronounced security concerns, with a higher proportion strongly agreeing (28%) compared to Google Pay users (9%).

19. Barrier 2: Trust in Google Pay/PhonePe Brand

Count of Respondents	Primary mobile payment app you use		
I trust the reputation and brand image of Google Pay/PhonePe over other payment apps.	Google Pay	PhonePe	Grand Total
Agree	23	27	50
Disagree	3	1	4
Neutral	11	7	18
Strongly agree	9	17	26
Strongly disagree	1	1	2
Grand Total	47	53	100

Chart

Interpretation

➤ Trust in Reputation and Brand Image:

- The table shows respondents' trust in the reputation and brand image of Google Pay or PhonePe over other payment apps.
- The data is split between users of Google Pay and PhonePe .

➤ Breakdown of Responses:

- Among Google Pay users:

- 23 individuals agree that they trust the reputation and brand image of Google Pay over other payment apps.
 - 3 individuals disagree.
 - 11 individuals are neutral.
 - 9 individuals strongly agree.
 - 1 individual strongly disagrees.
- Among PhonePe users:
 - 27 individuals agree that they trust the reputation and brand image of PhonePe over other payment apps.
 - 1 individual disagrees.
 - 7 individuals are neutral.
 - 17 individuals strongly agree.
 - 1 individual strongly disagrees.

➤ **Overall Agreement:**

- Combining the responses, a majority of respondents (76%) either agree or strongly agree that they trust the reputation and brand image of their chosen app over other payment apps:
 - 50% agree.
 - 26% strongly agree.
- This indicates a high level of trust in the brand image of both Google Pay and PhonePe among users.

➤ **Neutral and Disagreement:**

- A smaller proportion of respondents are either neutral (18%) or disagree (6%) with the statement:
 - 18% are neutral.
 - 4% disagree.
 - 2% strongly disagree.
- These respondents may have mixed feelings about the brand image or may consider other factors more important than brand reputation.

➤ **Comparison Between Google Pay and PhonePe :**

- A higher percentage of PhonePe users (44 out of 53, or 83%) either agree or strongly agree compared to Google Pay users (32 out of 47, or 68%) that they trust the reputation and brand image of their chosen app.
- PhonePe users appear to have a stronger trust in their app's brand image, with a higher proportion strongly agreeing (32%) compared to Google Pay users (19%).

HYPOTHESIS

Hypothesis 1: To Quantify the impact of mobile payment apps on specific financial behaviour

Null Hypothesis (H0): There is no significant difference in the impact of Google Pay and PhonePe on specific financial behaviour among youth.

Alternative Hypothesis (H1): There is a significant difference in the impact of Google Pay and PhonePe on specific financial behaviour among youth.

Correlation

	<i>Spending Behavior</i>	<i>Savings Behavior</i>
Spending Behavior	1	
Savings Behavior	0.334305598	1

The positive correlation coefficient ($r = 0.334$) between Spending Behaviour and Savings Behaviour indicates that there is a weak to moderate positive relationship between these two variables. This means that as spending Behaviour increases, savings Behaviour tends to increase as well, although the strength of this relationship is not very strong.

Regression

<i>Regression Statistics</i>							
Multiple R	0.334305598						
R Square	0.111760233						
Adjusted R Square	0.102696562						
Standard Error	0.993541352						
Observations	100						
ANOVA							
	<i>df</i>	<i>SS</i>	<i>MS</i>	<i>F</i>	<i>Significance F</i>		
Regression	1	12.17180698	12.17181	12.33057	0.000675379		
Residual	98	96.73819302	0.987124				
Total	99	108.91					

	<i>Coefficients</i>	<i>Standard Error</i>	<i>t Stat</i>	<i>P-value</i>	<i>Lower 95%</i>	<i>Upper 95%</i>	<i>Lower 95.0%</i>	<i>Upper 95.0%</i>
Intercept	3.008213552	0.307477995	9.783508	3.57E-16	2.398033479	3.618393625	2.398033479	3.618393625
Savings Behavior	0.298767967	0.085082933	3.511491	0.000675	0.129923656	0.467612278	0.129923656	0.467612278

The regression analysis further confirms the relationship between Spending Behaviour and Savings Behaviour . The coefficient for Savings Behaviour (0.2988) indicates that for every one-unit increase in Savings Behaviour , we can expect a 0.2988 unit increase in Spending Behaviour . Since the coefficient is statistically significant (p-value = 0.000675), we have evidence to suggest that there is a significant relationship between Savings Behaviour and Spending Behaviour .

ANOVA SINGLE FACTOR

SUMMARY						
<i>Groups</i>	<i>Count</i>	<i>Sum</i>	<i>Average</i>	<i>Variance</i>		
Spending Behavior	100	403	4.03	1.100101		
Savings Behavior	100	342	3.42	1.377374		
ANOVA						
<i>Source of Variation</i>	<i>SS</i>	<i>df</i>	<i>MS</i>	<i>F</i>	<i>P-value</i>	<i>F crit</i>
Between Groups	18.605	1	18.605	15.01933	0.000145	3.888853
Within Groups	245.27	198	1.238737			
Total	263.875	199				

The ANOVA test compares the means of Spending Behaviour and Savings Behaviour across the groups of Google Pay and PhonePe users. The significant p-value (0.000145) indicates that there are statistically significant differences in the mean levels of Spending Behaviour and Savings Behaviour between users of Google Pay and PhonePe . This suggests that the choice of mobile payment app (Google Pay or PhonePe) has an impact on specific financial Behaviour s among youth.

INTERPRETATION

Combining the results of the correlation analysis, regression analysis, and ANOVA test, we find consistent evidence to reject the null hypothesis (H_0). This means that there is a significant difference in the impact of Google Pay and PhonePe on specific financial Behaviours among youth. Specifically, users of these two mobile payment apps exhibit differences in their spending and saving Behaviours, and these differences are statistically significant.

Therefore, we can conclude that there is empirical support for the alternative hypothesis (H_1), indicating that Google Pay and PhonePe have differing impacts on specific financial Behaviours among youth.

CONCLUSION

The analysis provided strong evidence to reject the null hypothesis. There is a significant difference in the impact of Google Pay and PhonePe on specific financial Behaviours among youth. Users of these apps exhibit varying financial Behaviours, suggesting that the choice of mobile payment app influences how individuals manage their finances.

Hypothesis 2: To identify key motivators and barriers for adoption based on user segments

Null Hypothesis (H0): Key motivators and barriers for the adoption of mobile payment apps do not vary significantly across different user segments among youth.

Alternative Hypothesis (H1): Key motivators and barriers for the adoption of mobile payment apps vary significantly across different user segments among youth.

Correlation

	<i>Primary Motivator for Using Mobile Payment Apps</i>	<i>Primary Barrier to Using Mobile Payment Apps</i>
Primary Motivator for Using Mobile Payment Apps	1	
Primary Barrier to Using Mobile Payment Apps	0.122092287	1

The correlation coefficient between the Primary Motivator for Using Mobile Payment Apps and the Primary Barrier to Using Mobile Payment Apps is approximately 0.122.

A correlation coefficient measures the strength and direction of the linear relationship between two variables. Here, the correlation coefficient is 0.122 that suggests a weak positive correlation between the Primary Motivator for Using Mobile Payment Apps and the Primary Barrier to Using Mobile Payment Apps.

The positive sign indicates that as the score for one variable increases, the score for the other variable tends to increase slightly as well, albeit weakly.

However, a correlation coefficient of 0.122 is relatively low, indicating that the relationship between these two variables is weak. This suggests that there is only a slight tendency for individuals who report stronger motivators for using mobile payment apps to also report slightly higher barriers to using them.

Based on the correlation coefficient of 0.122, It can be said that there is a weak positive correlation between the Primary Motivator for Using Mobile Payment Apps and the Primary Barrier to Using Mobile Payment Apps among the respondents. However, the strength of this relationship is relatively weak.

Regression

Regression Statistics								
Multiple R	0.1220923							
R Square	0.0149065							
Adjusted R Square	0.0048546							
Standard Error	1.1938465							
Observations	100							
ANOVA								
	<i>df</i>	<i>SS</i>	<i>MS</i>	<i>F</i>	<i>Significance F</i>			
Regression	1	2.113596396	2.113596	1.482945	0.226238254			
Residual	98	139.6764036	1.425269					
Total	99	141.79						
	<i>Coefficients</i>	<i>Standard Error</i>	<i>t Stat</i>	<i>P-value</i>	<i>Lower 95%</i>	<i>Upper 95%</i>	<i>Lower 95.0%</i>	<i>Upper 95.0%</i>
Intercept	2.8098822	0.491111755	5.721472	1.15E-07	1.835286872	3.784477461	1.83528687	3.78447746
Primary Motivator for Using Mobile Payment Apps	0.1446678	0.118798046	1.217762	0.226238	-0.091083067	0.380418645	-0.09108307	0.38041865

In this case, the p-value for the regression model is 0.226, which is greater than the typical significance level of 0.05. Therefore, we fail to reject the null hypothesis, suggesting that the regression model as a whole is not statistically significant.

The regression model for Hypothesis 2 does not provide sufficient evidence to conclude that the Primary Motivator for Using Mobile Payment Apps has a statistically significant effect on the Primary Barrier to Using Mobile Payment Apps among the respondents.

The low R-squared value (0.015) indicates that only a very small proportion of the variance in the Primary Barrier to Using Mobile Payment Apps can be explained by the Primary Motivator for Using Mobile Payment Apps.

The p-value for the regression model and the predictor variable are both greater than the typical significance level of 0.05, suggesting that there is insufficient evidence to reject the null hypothesis.

ANOVA SINGLE FACTOR

<i>Groups</i>	<i>Count</i>	<i>Sum</i>	<i>Average</i>	<i>Variance</i>		
Primary Motivator for Using Mobile Payment Apps	100	401	4.01	1.020101		
Primary Barrier to Using Mobile Payment Apps	100	339	3.39	1.432222		
ANOVA						
<i>Source of Variation</i>	<i>SS</i>	<i>df</i>	<i>MS</i>	<i>F</i>	<i>P-value</i>	<i>F crit</i>
Between Groups	19.22	1	19.22	15.67493	0.000105	3.888853
Within Groups	242.78	198	1.226162			
Total	262	199				

The p-value (0.0001) is less than the chosen significance level (typically 0.05), indicating that there is a statistically significant difference between the groups' means regarding their primary motivator or barrier for using mobile payment apps. Therefore, we reject the null hypothesis (H_0) and conclude that there is a significant variation in primary motivators or barriers across different user segments among youth.

INTERPRETATION

Based on the correlation, regression, and ANOVA analyses conducted for Hypothesis 2, we reject the null hypothesis and conclude that there are significant differences in the primary motivators or barriers for the adoption of mobile payment apps across different user segments among youth. This suggests that understanding these variations is crucial for tailoring strategies to promote mobile payment app adoption effectively among different user groups.

CONCLUSION

The analysis of Hypothesis 2 reveals significant variations in motivators and barriers for mobile payment app adoption among youth, as evidenced by weak correlation, insignificant regression coefficients, and significant differences in mean scores. Tailored strategies are essential to address diverse user segment preferences effectively.

Hypothesis 3: To compare the effectiveness of specific features in driving financial inclusion and literacy

Null Hypothesis (H0): There is no significant difference in the effectiveness of specific features of Google Pay and PhonePe in driving financial inclusion and literacy among youth.

Alternative Hypothesis (H1): There is a significant difference in the effectiveness of specific features of Google Pay and PhonePe in driving financial inclusion and literacy among youth.

Correlation

	<i>Effectiveness of Budgeting and Expense Tracking Features</i>	<i>Effectiveness of Savings and Investment Features</i>
Effectiveness of Budgeting and Expense Tracking Features	1	
Effectiveness of Savings and Investment Features	0.73601766	1

The correlation coefficient ($r = 0.736$) between the Effectiveness of Budgeting and Expense Tracking Features and the Effectiveness of Savings and Investment Features is relatively strong. This indicates a positive correlation between the two variables, suggesting that as the effectiveness of budgeting and expense tracking features increases, the effectiveness of savings and investment features also tends to increase.

Regression

Regression Statistics								
Multiple R	0.73601766							
R Square	0.541722							
Adjusted R Square	0.53704569							
Standard Error	0.79853685							
Observations	100							
ANOVA								
	<i>df</i>	<i>SS</i>	<i>MS</i>	<i>F</i>	<i>Significance F</i>			
Regression	1	73.86921136	73.86921	115.844	2.69185E-18			
Residual	98	62.49078864	0.637661					
Total	99	136.36						
	<i>Coefficients</i>	<i>Standard Error</i>	<i>t Stat</i>	<i>P-value</i>	<i>Lower 95%</i>	<i>Upper 95%</i>	<i>Lower 95.0%</i>	<i>Upper 95.0%</i>
Intercept	0.48062438	0.284533057	1.689169	0.094366	-0.084022216	1.04527097	-0.0840222	1.045270968
Effectiveness of Budgeting and Expense Tracking Features	0.81876758	0.076071832	10.76308	2.69E-18	0.667805509	0.96972966	0.66780551	0.969729657

The regression analysis shows that the p-value associated with the coefficient for the Effectiveness of Budgeting and Expense Tracking Features is very small (2.69E-18), which is less than the significance level of 0.05. This indicates that the coefficient is statistically significant, suggesting that there is a significant relationship between the Effectiveness of Budgeting and Expense Tracking Features and the Effectiveness of Savings and Investment Features. Additionally, the R-squared value (0.541) indicates that approximately 54.1% of the variability in the Effectiveness of Savings and Investment Features can be explained by the Effectiveness of Budgeting and Expense Tracking Features.

ANOVA SINGLE FACTOR

<i>Groups</i>	<i>Count</i>	<i>Sum</i>	<i>Average</i>	<i>Variance</i>		
Effectiveness of Budgeting and Expense Tracking Features	100	359	3.59	1.11303		
Effectiveness of Savings and Investment Features	100	342	3.42	1.377374		
ANOVA						
<i>Source of Variation</i>	<i>SS</i>	<i>df</i>	<i>MS</i>	<i>F</i>	<i>P-value</i>	<i>F crit</i>
Between Groups	1.445	1	1.445	1.160454	0.282682	3.888853
Within Groups	246.55	198	1.245202			
Total	247.995	199				

The ANOVA test compares the means of the Effectiveness of Budgeting and Expense Tracking Features and the Effectiveness of Savings and Investment Features. The p-value associated with the test (0.282682) is greater than the significance level of 0.05. This indicates that there are no statistically significant differences in the means of these variables between Google Pay and PhonePe .

INTERPRETATION

Based on the results of the correlation analysis, regression analysis, and ANOVA test, we find that the null hypothesis (H0) cannot be rejected. This means that there is no significant difference in the effectiveness of specific features of Google Pay and PhonePe in driving financial inclusion and literacy among youth. Therefore, based on the evidence provided, the null hypothesis should be accepted.

CONCLUSION

The analysis indicated that the null hypothesis cannot be rejected. There is no significant difference in the effectiveness of specific features of Google Pay and PhonePe in driving financial inclusion and literacy among youth. Both apps demonstrate similar effectiveness in enhancing financial inclusion and literacy among users.

In Summary,

This study investigates three hypotheses on mobile payment apps (Google Pay and PhonePe) and their effects on teenage financial behaviour .

Hypothesis 1:

To Quantify the impact of mobile payment apps on specific financial behaviou .

The correlation ($r = 0.334$) and regression analyses indicate a significant relationship between spending and savings behaviour, while ANOVA shows significant differences between Google Pay and PhonePe users ($p\text{-value} = 0.000145$). Thus, the null hypothesis is rejected, confirming that these apps impact financial behaviour differently. This highlights the need for tailored financial strategies based on the app used.

Hypothesis 2

To identify key motivators and barriers for adoption based on user segments.

A weak correlation ($r = 0.122$) was observed between motivators and barriers. Regression results ($p\text{-value} = 0.226$) were not significant, while the ANOVA ($p\text{-value} = 0.0001$) showed significant differences across user segments. Consequently, the null hypothesis is rejected, indicating varying motivators and barriers across segments. This suggests the importance of targeted approaches for different user segments to enhance adoption.

Hypothesis 3

To compare the effectiveness of specific features in driving financial inclusion and literacy.

A strong positive correlation ($r = 0.736$) and significant regression ($p\text{-value} = 2.69\text{E-}18$) were found between budgeting/expense tracking and savings/investment features. However, ANOVA results ($p\text{-value} = 0.282682$) showed no significant differences between apps. Therefore, the null hypothesis is accepted, showing no significant difference in feature effectiveness for financial inclusion and literacy between the two apps. This indicates that both apps are similarly effective in promoting financial inclusion and literacy, suggesting that app-specific features equally support financial education.

CHAPTER 6

FINDINGS AND CONCLUSION

FINDINGS

Based on extensive research and analysis, this study uncovers crucial insights into the impact of mobile payment apps on financial behaviour and literacy among youth, shedding light on varied user perceptions and behaviour .

1. Users perceive Google Pay and PhonePe differently

There is a significant difference in how users perceive Google Pay and PhonePe in terms of trust and brand reputation (Hypothesis 2). (Reference: Barrier 2 section)

2. Impact on financial q

Google Pay and PhonePe influence distinct financial behaviour among youth, with significant differences noted in spending and savings habits (Hypothesis 1). (Reference: Hypothesis 1 and related sections)

3. Motivators for adoption

Convenience and speed are primary motivators for both Google Pay and PhonePe users, though PhonePe users show a slightly stronger preference in this regard (Motivator 1 section). (Reference: Motivator 1 section)

4. Social influence on adoption

Friends and family exert a notable influence on the adoption of both Google Pay and PhonePe , with a stronger effect observed among PhonePe users (Motivator 2 section). (Reference: Motivator 2 section)

5. Educational tools utilization

Users engage variably with financial education tools provided by the apps, with PhonePe users showing slightly higher engagement compared to Google Pay users (Motivator 3 section). (Reference: Motivator 3 section)

6. Effectiveness in promoting financial responsibility

A majority of users agree that bill reminders within the apps enhance financial responsibility, with strong agreement among some segments (Effectiveness of Bill Reminders section). (Reference: Effectiveness of Bill Reminders section)

7. Impact on financial inclusion

Both Google Pay and PhonePe are perceived to contribute significantly to financial inclusion among young people, although opinions vary slightly between the two apps (Utilization of Financial Inclusion Features section). (Reference: Utilization of Financial Inclusion Features section)

8. Adverse impact concerns

A notable percentage of users perceive a moderate to high adverse impact from using mobile payment apps, highlighting varied experiences (Impact Assessment section). (Reference: Impact Assessment section)

9. Security concerns

Security remains a substantial barrier, particularly for Google Pay users, influencing their frequency of app usage (Barrier 1 section). (Reference: Barrier 1 section)

10. Differences in feature effectiveness

While both apps offer similar features, there is no statistically significant difference in how effective these features are perceived in driving financial inclusion and literacy (Hypothesis 3). (Reference: Hypothesis 3 and related sections)

11. Correlation between spending and savings

There is a weak to moderate positive correlation between spending behaviour and savings behaviour among users, indicating some degree of financial balance (Correlation section). (Reference: Correlation section)

12. Variation in user segments

Different user segments exhibit varying motivators and barriers for adopting mobile payment apps, emphasizing the need for tailored strategies (Hypothesis 2). (Reference: Hypothesis 2 and related sections)

13. Perception of financial education

Users show varied perceptions of the usefulness of financial education tools provided by the apps, impacting their engagement levels (Motivator 3 section). (Reference: Motivator 3 section)

14. Impact on spending behaviour

The choice of mobile payment app influences spending behaviour differently, as evidenced by significant differences in ANOVA results (Hypothesis 1). (Reference: Hypothesis 1 and related sections)

15. Overall trust and reputation

A majority of users trust the reputation and brand image of their chosen app, indicating strong brand loyalty within these segments (Barrier 2 section). (Reference: Barrier 2 section)

CONCLUSION

In this study, we researched the complex dynamics pertaining to the adoption and effects of mobile payment apps, with a particular emphasis on Google Pay and PhonePe among young people. Our results provide important new information about how these technologies affect financial behaviour, encourage adoption, and create obstacles for this group of people.

The study firstly clarifies that Google Pay and PhonePe have observable effects on young people's spending habits. Though they both allow for financial management and transactions, the subtle variations between the two systems influence how users approach saving and spending money. The disparities between the functions that each app plays in encouraging financial responsibility were brought to light by the correlation and regression analyses.

Secondly, motivators and barriers to using mobile payment apps emerged to be vital elements in affecting user preferences. Peer pressure, speed, and convenience were found to be the main drivers that greatly influenced adoption rates. On the other hand, security and brand reputation trust issues were significant obstacles, especially for those groups more sensitive to these issues. With the goal of improving user engagement and satisfaction, developers and marketers must have a thorough understanding of these drivers and obstacles.

Finally, the study emphasizes the larger impact of mobile payment technology on financial inclusion and literacy. Google Pay and PhonePe are two services that provide resources to improve accessibility and understanding of finances. Although there were no statistically significant variations in their effectiveness in fostering financial literacy, the overall positive association between feature effectiveness and financial behaviour highlights their potential benefit in equipping users with financial management abilities.

In conclusion, this research contributes valuable insights into the evolving landscape of mobile payment apps among youth. By unpacking these dynamics, we provide a foundation for tailored strategies aimed at maximizing the benefits of these technologies while addressing user concerns. Moving forward, continued research is crucial to adapt to evolving user needs and technological advancements, ensuring that mobile payment apps continue to play a transformative role in fostering financial inclusion and literacy in the digital era.

RECOMMEDATIONS

Based on the findings of this study, various recommendations can be made to increase the adoption, effectiveness, and user experience of mobile payment apps such as Google Pay and PhonePe among young people. These recommendations are aimed at addressing major motivators and challenges identified in the research, as well as exploiting the platforms' capabilities to promote financial inclusion and knowledge.

Firstly, mobile payment app providers must strengthen security measures and effectively convey these advances to users. Given that security concerns are a major impediment to adoption, establishing robust security mechanisms and frequently updating them might help to increase user trust. Furthermore, app providers should proactively educate users about these security features via in-app notifications, emails, and social media ads. Transparent disclosure about data privacy and security procedures will reassure users and may enhance app adoption.

Second, in order to enhance an extensive user base, mobile payment apps should include more tailored and targeted financial education tools. Because the study found various levels of engagement with instructional aids, apps may include adaptive learning systems that adjust information to specific user requirements and preferences. This could contain interactive modules, quizzes, and personalized advice based on user activity. Making financial education more entertaining and relevant increases the likelihood that users will use these tools, improving their financial literacy and overall app experience.

Finally, cultivating a feeling of community and social influence may significantly boost the uptake and continued usage of mobile payment apps. Friends and family play an important role in encouraging app adoption, thus incorporating social features like referral programs, peer-to-peer payment challenges, and social media sharing choices can increase this effect. Encouraging users to share their positive experiences and triumphs with money management through the app can result in a network effect, in which the program's benefits are organically pushed within social circles. This technique not only promotes user acquisition but also improves retention and engagement.

Focusing on these guidelines allows mobile payment app providers to remove critical hurdles, increase user engagement, and promote financial inclusion and literacy, resulting in a more robust and user-centric financial ecosystem.
